

Sourdough steps

Everything kept around 27-28c

Starter

Feed twice a day,

1 part starter

6 part water

9 part flour (can use all types, often add rye)

(approximate)

For the bread (using bakers %, taking flour content as 100%)

800g bread flour (100%)

680g Bread flour

90g Whole wheat flour

30g dark rye flour

160g starter (20%)

624-656g water (78% - 82%)

16g salt (2%)

Dusting flour

100g Bread flour

200g rice flour

Example timing:

12:00pm Mix and knead all ingredients except salt in a stand mixer. After it is homogenous add in the salt and knead again. (it will be quite wet, sticky, lumpy and shaggy)

Let sit and autolyse for 45 min - 1 hour

1:00pm Transfer to a big bowl and do coil folds, grab the middle and bring up and fold into a spiral. Coil fold until the surface is just about to tear then stop. (the dough should become shinier and smoother, rather than a sticky puddle)

1:45-4:45pm Coil-fold every hour ish. Avoid tearing the surface/gluten. (will become very smooth)

Around 4-5 hours after initial mixing, let the dough rise for 1.5-2 hours until very airy, and can see bubbles below.

6:30pm Turn over onto a dusted counter, and divide into 2 portions and roll up into a ball carefully without popping the bubbles. Cover with a towel or bowl and let it rest for 30 min to let gluten relax.

7pm perform shaping, depends on batard or boule shape. For boule (round), flip the ball over and stretch the sides and fold it to the center, continue until tight (no tearing), then dust the smooth side generously with the dusting flour and put in a banneton. For batard shape, stretch the dough forwards, then bring the two sides together and pinch into a log. Then roll the log, pinch the slides, dust the smooth side and place into the banneton.

Cold proof 7pm - next day 8/9 am.

Take out the loaf and let it warm up for 1 hour (if it seems flat let it warm for longer until it inflates again, one time i let it warm up for 3 hours)
Preheat oven with dutch oven to 500f. Then place loaf in the dutch oven, do a very quick score on the loaf at 45 degrees and about 1cm deep. Spray generously with water, cover and bake for 45 min.

Take it out and let it cool at rtp for at least 30 min before slicing.

Bread flour : <https://a.co/d/01vMqLwX>

14.5% protein, W 370-390, P/L 0.5-0.6. High protein (>13%) and high P/L (above 0.5) are necessary for long fermentation, and can resist weakening from acid. High W means the flour can absorb more water, if W is lower use less, but W is not often given.

Dark rye flour : <https://a.co/d/0gAu4wb6>

I like this dark rye flour as it has a nice flavour, especially in the starter, helps give a really nice creaminess. But the grain is quite large and if too much is used it can cut and weaken the gluten strands.

Whole grain flour: <https://a.co/d/0eHtk0S>

This whole grain flour is not really whole grain, more like halfway between bread and whole grain flour. It adds a nice maltiness and helps develop colour.

Additions:

Can use Vital wheat gluten to supplement a low gluten flour

Can add wheat bran during the folding stage, adding some more fibre, also absorbs excess water if the dough is really too wet even after a few coil folds.

Love adding cut malted rye grains, used to use it a lot in the UK, gives a super dark color and super nice malted flavour

<https://www.shipton-mill.com/products/cut-malted-rye-grains-500g-306>

But unable to find in smaller bags so far in the US other than in 5lbs bags from beer brewing shops.

Dark malt powder and Diastatic malt powder can also be dissolved in the water to give more flavour.

If additions that are high in sugar, such as the malted grains, black treacle/ blackstrap molasses, reduce fermentation time accordingly.
